# Recent Data Breaches

|                     | Affected users |
|---------------------|----------------|
| Gawker              | 1,300,000      |
| Sony                | 25,000,000     |
| Battlefield Heroes  | 550,000        |
| Sega                | 1,300,000      |
| Booz Allen Hamilton | 90,000         |
| Bloggtoppen         | 90,000         |
| Valve               | 700,000        |

“The passwords are stored encrypted, but with enough effort and depending on the quality of the password, they can be cracked. This, I'm afraid, is a serious threat; it means that anyone who uses the same email/password on other systems is now vulnerable to a malicious attacker using that information to access their account.”

Jeremy White, CEO of Codeweavers  
October 2011

# Threat Model

## Offline Attack

- Attacker has password file
- Needs to guess passwords to crack them

# Threat Model

## Offline Attack

- Attacker has password file
- Needs to guess passwords to crack them
- Attacker can make many guesses
- Smart guessing strategy

# Guessing Strategy

## Dumb attacker

aaaaaaaa

aaaaaaab

aaaaaaac

aaaaaaad

aaaaaaae

...

## Smart attacker

123456789

password

iloveyou

princess

12345678

...

**Smart attacker uses data to crack  
passwords more quickly**

# Threat Model

## Offline Attack

- Attacker has password file
- Needs to guess passwords to crack them
- Attacker can make many guesses
- Smart guessing strategy

# Password-composition Policies

- Intended to make passwords harder to guess

# Password-composition Policies

### **Login error**

Passwords must be at least 1 character.

# Password Requirements

Adhere to the following password requirements, when selecting your Andrew account pas

| Must Contain   |
|--|
| <ul style="list-style-type: none"><li>• At least 8-characters.</li><li>• At least one uppercase alphabetic character (e.g., A-Z).</li><li>• At least one lowercase alphabetic character (e.g., a-z).</li><li>• At least one number (e.g., 0-9).</li><li>• At least one special character (e.g., ~!@#\$%^&amp;*()_-=).</li></ul>  |
| Cannot Contain   |
| <ul style="list-style-type: none"><li>• Known information (i.e., first name, last name, Andrew userID, date of birth, 9-digit Carnegie Mellon ID number, SSN, job title).</li><li>• Four or more occurrences of the same character (e.g., aaaa, 2222, a123a345a678a).*</li><li>• A word that is found in a standard dictionary.*<br/><b>Note:</b> Verify that the letters within your password do not spell a word after you remove any non-alphabetical or special characters. The system checks all of the letters of the password together. <a href="#">Details...</a></li></ul> <p><b><i>*This requirement does not apply to Andrew account passwords that are more than 19 characters in length (e.g., passphrase).</i></b></p> |
| Additional Policies  |
| <ul style="list-style-type: none"><li>• Last five passwords cannot be used.</li><li>• Cannot be changed more than four times in a day.</li></ul>   |

# Existing Guidance

- NIST guide not based on empirical evidence
- No empirical data on user behavior

# Password-composition Policies

- Users can struggle to create and remember complex passwords [Zviran & Haga 1999, Procter et al. 2002, Yan et al. 2004, Vu et al. 2007, and many others...]
- Security can suffer if usability is poor [Sasse et al. 2001, and many others...]

# Contributions

- Measured guessability across seven password-composition policies
  - Threat model: offline attack
- Studied the impact of tuning and data selection on policy evaluation
- Compare security metrics across policies
  - Correlate security with usability

# Policy Metrics

- Guessability
  - Measure of how easy it is to guess passwords
- Estimated entropy [Our previous work 2010]

# Policy Metrics

- Guessability
  - Measure of how easy it is to guess passwords
- Estimated entropy [Our previous work 2010]
- NIST entropy [NIST SP 800-63]
- Usability [Our previous work 2011]
  - Login failures
  - Reported sentiment
  - Writing down

# Guessability

- Measure of password strength  
Stronger = less guessable
- Guess number: The number of attempts needed to guess a password

# Guessability

Bob's password

`iloveyou`

Attacker's guesses

1 `123456789`

2 `password`

3 `iloveyou`

4 `princess`

...

# Guessability

1 123456789

2 password

3 **iloveyou**

4 princess

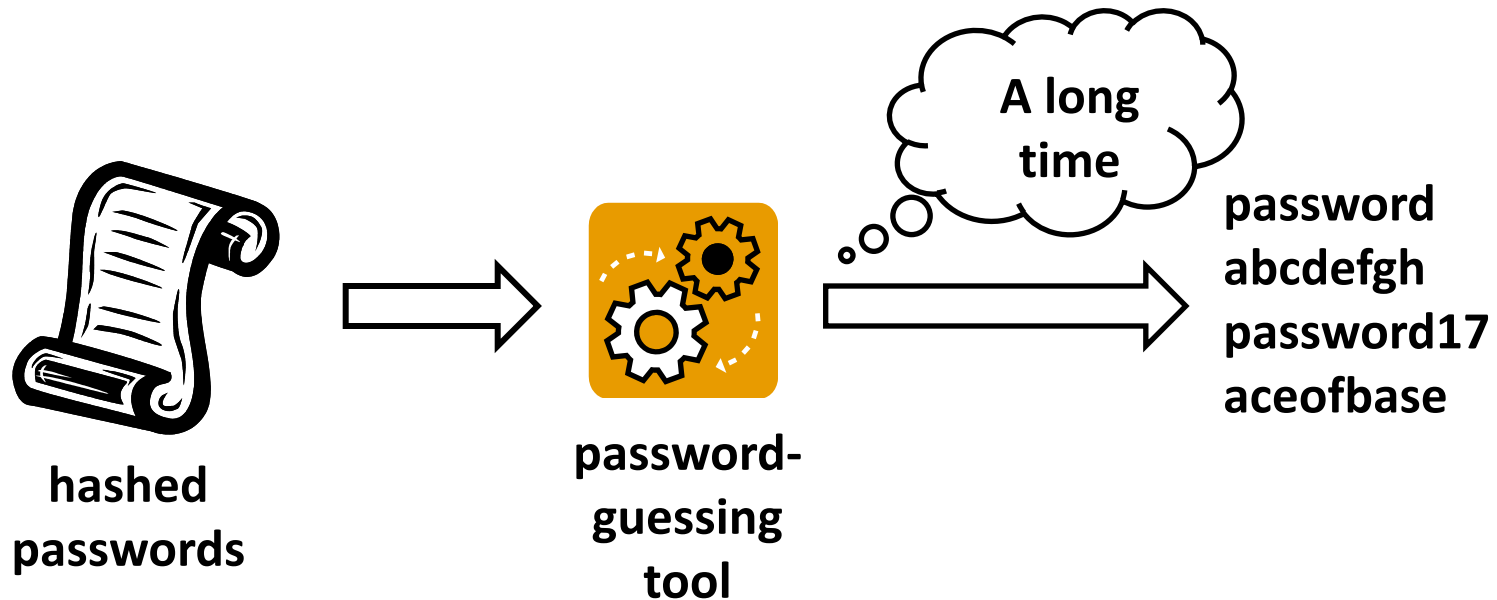

...

Guess number

**3**

# Measuring Guessability

Traditional approach: Run cracking tool

# Offline Attack Speed

## Single-core CPU

|                           |        |
|---------------------------|--------|
| 1,500 guesses/s           | sha512 |
| 130,000,000 guesses/day   | sha512 |
| 2,200,000,000 guesses/day | md5    |

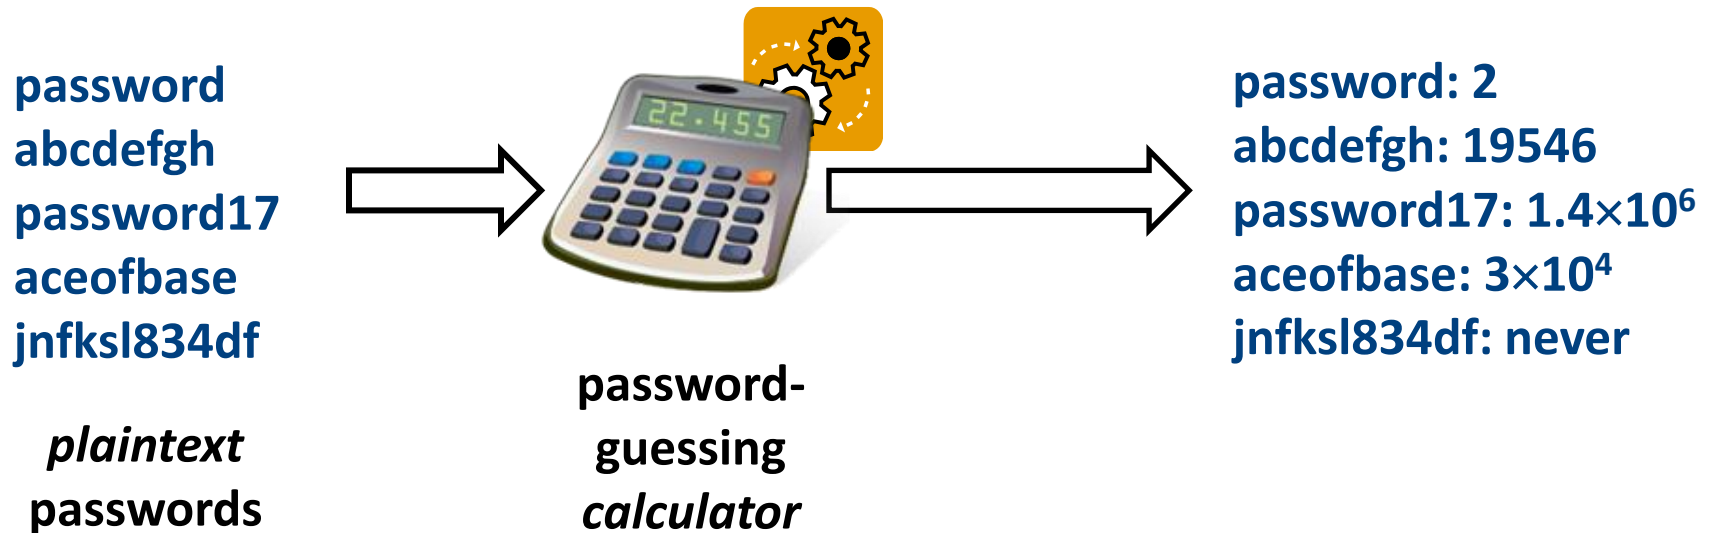

## Mid-level GPU

|                            |     |
|----------------------------|-----|
| 34,000,000,000 guesses/day | md5 |
|----------------------------|-----|

*Source: John the Ripper Test Mode and Wiki ([openwall.info](http://openwall.info))*

# Measuring Guessability

Our approach: Calculate guess numbers directly

# Threat Model

- Offline attacker that can make a huge number of guesses
  - This paper: 50 trillion ( $5 \times 10^{13}$ ) guesses on each password
    - 25,000 CPU days with MD5 hashes

# Selecting an Attacker

- John the Ripper
- Markov model [Narayanan and Shmatikov 2005]
- Weir's probabilistic context-free grammar [Weir et al. 2009]

# Selecting an Attacker

- John the Ripper
- Markov model [Narayanan and Shmatikov 2005]
- Weir's probabilistic context-free grammar
  - Performed best
  - Previous work found similar result [Weir et al. 2010, Zhang et al. 2010]

# Training Data

- Leaked datasets
  - RockYou (32M passwords)
  - MySpace (47K passwords)

# Training Data

- Leaked datasets
  - RockYou (32M passwords)
  - MySpace (47K passwords)
- Dictionaries
  - Openwall (40M passwords)
  - Unix dictionary (235K words)
  - Inflection list (162K words)
- Collected passwords (12K total passwords)

# Threat Model

- Offline attacker that can make up to 50 trillion guesses
- Order of guesses based on Weir's algorithm
  - Attacker learns from training data
    - Leaked data plus collected passwords
    - Attacker has limited knowledge of the target policy

# Data Collection

- Mechanical Turk used for anonymous recruitment and payment
  - Enabled study of many participants
    - 1,000+ per condition
  - Well-designed studies can produce high-quality data [Burhmester et al. 2011]
  - Workers prevented from participating multiple times
  - Payment: 55¢ + 70¢

# Study Design

- Hypothetical email scenario for password creation

## Steps:

1. Create a password under a randomly assigned condition
2. Take a survey
3. Recall password
4. Return in two days

# Condition: Basic8

**password**

NIST estimate: 18 bits

# Condition: Dictionary8

**sapsword**

NIST estimate: 24 bits

Condition: Comprehensive8

**Sapsword1 !**

NIST estimate: 30 bits

# Condition: Basic16

**passwordpassword**

NIST estimate: 30 bits

# Condition: Blacklist x 3

- Blacklists:
  - Easy: 235K Unix dictionary
  - Medium: 40M entry cracking wordlist
  - Hard: 5B guesses from Weir
- Only requirement is that candidate password is not on a blacklist

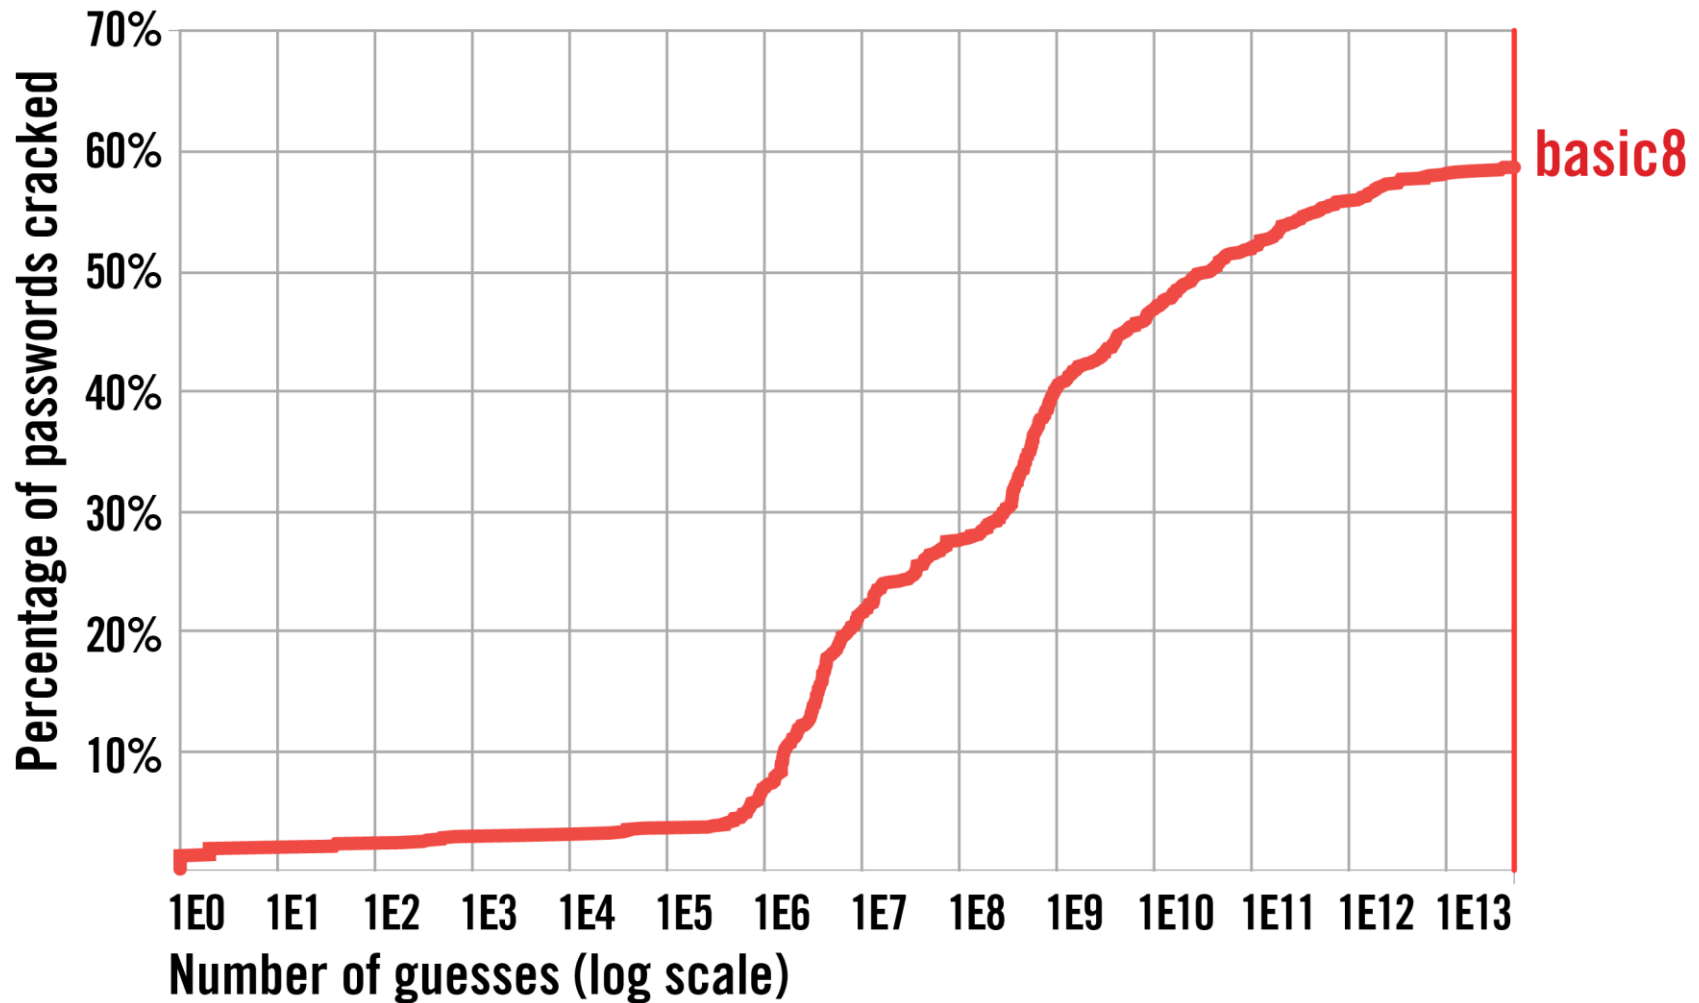

NIST estimate: 24 bits

# Contributions

- Measured guessability across seven password-composition policies
  - Threat model: offline attack
- Studied the impact of tuning and test-set selection on policy evaluation
- Compare security metrics across policies
  - Correlate security with usability

# Comparing Metrics

# Comparing Metrics

# Usability - Basic16 & Comprehensive8

- Basic16 is more usable [Our previous work 2011]
  - Fewer participants wrote down password (50% vs. 33%)
  - Self-reported difficulty and annoyance was lower

**Basic16 appears to be more secure and more usable than comprehensive8**

# Conclusions

- In some cases, more secure  $\neq$  less usable

# Conclusions

- In some cases, more secure  $\neq$  less usable
- Complex policies are tricky to analyze
  - Need high-quality training data
  - Important to choose test data carefully

# Conclusions

- In some cases, more secure  $\neq$  less usable
- Complex policies are tricky to analyze
  - Need high-quality training data
  - Important to choose test data carefully
- Existing guidance is not very helpful

# Questions?

# Existing Guidance

- NIST guide not based on empirical evidence
  - Provides a means of “scoring” password policies

***NIST would like to obtain more data on the passwords users actually choose, but, where they have the data, system administrators are understandably reluctant to reveal password data to others. – [Burr 2006]***

best  $\frac{1}{3}$

Total guesses:      24

## structures

$L_4 S_1 L_4$   $\frac{1}{2}$

$(UL_3) S_1 D_3$   $\frac{1}{2}$

# Basic8 frequencies

12345678            1.3%

Password            0.7%

123456789           0.6%

Five appeared twice

Rest were unique

**N = 1000**

# Demographics

- 1,000 participants per condition
- 51% male, 47% female
- Mean age: 29.8 years
- No significant difference across conditions
- 2,889 returned within three days of follow-up email

# Hypothetical Email Scenario

Imagine that your main email service provider has been attacked, and your account became compromised. You need to create a new password for your email account, since your old password may be known by the attackers. Because of the attack, your email service provider is also changing its password rules.

Please follow the instructions below to create a new password for your email account. We will ask you to use this password in a few days to log in again so it is important that you remember your new password. Please take the steps you would normally take to remember your email password and protect this password as you normally would protect the password for your email account. Please behave as you would if this were your real password!

# Comparing Metrics

# Basic16 vs Comprehensive8

- Basic16 requires significantly fewer attempts in password creation
  - 53% vs 18% success on first attempt,  $p < 0.001$
  - 1.66 vs 3.35 attempts total,  $p < 0.001$
- Comprehensive8 participants had significantly higher dropout rates
  - 19% vs 25%,  $p < 0.001$
