PIA/ PRA is relevant today

PIA: "a process whereby the potential impacts and implications of proposals that involve potential privacy-invasiveness are surfaced and examined" (Clarke'98)

- Privacy Impact Assessments (PIA) tend to focus more on organizational aspects than technical details
 - PIA = Privacy Risk Analysis + organizational aspects

 DPIA for smart grids by SGTF lacks in clarity in assessing impacts on data subjects, examples

Article 33 of the EU Regulation mandates data controllers to carry out PIA.

A true Privacy Risk Analysis (PRA) considers harms

It also considers technical ingredients

◆□▶ ◆□▶ ◆臣▶ ◆臣▶ 臣 のへぐ

- Privacy weaknesses
- Risk Sources
- Feared Events

Computer scientists hardly talk about privacy harms.

Legal scholars hardly talk about feared events, risk sources or privacy weaknesses.

< □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > <

So, what did we do?

We talk about all the ingredients and describe the relationship among them.

◆□▶ ◆□▶ ◆臣▶ ◆臣▶ 三臣 - のへで

Harm trees are central to a PRA

▲□▶ ▲□▶ ▲□▶ ▲□▶ ▲□ ● ● ●

Why smart grids?

Harms	Information revealed by smart meters	Pattern	Granularity
Burglary, profile based discrimination	When are you usually away from home?	High/ low power usage during the day	Hour/ minute
Burglary	Have you been away from home for some time?	High/ low power usage during the day	Day/ hour
Burglary, kidnapping, stalking, profile based discrimination	Is your home protected by an electronic alarm system?	Appliance activity matching alarm system signature	Minute/ second
Profile based discrimination	Do you stay at home all day watching TV or in front of the computer?	Appliance activity matching signature of TV, computer	Hour/ minute
Profile based discrimination, targeted advertising	Do you cook often or prefer to eat outside?	High/ low power events around meal times for microwave, cook tops etc.	Hour/ minute

Table: Information Revealed by Smart Meters and Resulting Privacy Harms

◆□▶ ◆□▶ ◆臣▶ ◆臣▶ 臣 のへぐ

What are privacy harms?

Negative impacts on a data subject, or a group of data subjects, or the society.

- Effects on physical, mental, financial well-being or reputation, dignity etc.
- Useful inputs to establish a list of harms are:
 - previous privacy breaches, case law, recommendations, stakeholder consultation

Code	Harm	Severity
H.1	Profile-based discrimination	Maximum
H.2	Burglary	Limited
H.3	Restriction of energy usage	Maximum
H.4	Kidnapping of a child	Significant

Table: Examples of harms and their severity values in a smart grid system

Profile-based discrimination includes increase/decrease in insurance premium, less favourable commercial conditions, reflection on job or loan applications etc.

▲ロト ▲帰 ト ▲ ヨ ト ▲ ヨ ト ・ ヨ ・ の Q ()

What are privacy weaknesses?

A weakness in the data protection mechanisms of a system or lack thereof.

- Can be found out from a description of existing legal, organizational and technical controls
- Privacy weaknesses due to choices of functionalities, design, implementation of the system

Code	Privacy weaknesses
V.1	Security vulnerabilities in Meter Data Management System
V.2	Unencrypted energy consumption data processing
V.3	Unencrypted transmission of energy consumption data from home appliances to smart meter
V.4	Non-enforcement of data minimization
V.5	No opt-outs for consumers for high volume/precision data collection
V.6	Insufficient system audit

Table: Some relevant privacy weaknesses in a smart grid system

What are risk sources?

An entity whose actions lead to privacy harms.

- Often referred to as *adversary* or *attacker* in the literature.
- Examples: system administrators, the utility provider, consumers, service technicians, operators or other employees, hackers.

What are feared events?

Occurs as a result of the exploitation of one or more privacy weaknesses.

Technical event between privacy weaknesses and harms

Code	Feared events	
FE.1	Excessive collection of energy consumption data	
FE.2	Use of energy consumption data for unauthorized purpose(s)	
FE.3	Unauthorized access to energy consumption data	
Table: Some relevant feared events in a smart grid system		

Harm trees link them all

Harm trees depict the relationship among risk sources, privacy weaknesses, feared events and harms.

◆□▶ ◆□▶ ◆臣▶ ◆臣▶ 三臣 - のへで

Risk likelihood is computed using harm trees

Figure: Example computation of likelihood of profile-based discrimination (H.4) using harm trees

 $\begin{array}{l} P_i \text{ is the likelihood of ith child node:} \\ \text{R1: AND with independent children: } \prod_i P_i. \\ \text{R2: AND with dependent children: } Min_i(P_i). \\ \text{R3: OR with independent children: } 1 - \prod_i (1 - P_i). \\ \text{R4: OR with children excluding one another: } \sum_i P_i. \end{array}$

Which harms are the riskiest?

Risk level for profile-based discrimination = (Maximum, Limited) Risk level for burglary = (Limited, Negligible)

Based on the risk levels, risk due to profile-based discrimination should be primary target for mitigation.

This conclusion depends on initial assumptions.

What else can be said?

Comparison of harm trees indicate which privacy weaknesses should be mitigated first.

Harm trees indicate the effect of a set of counter-measures on the risk likelihood.

The process ensures accountability by keeping track of all assumptions and choices made.

Thank you!
